#### **APPROVED BY:**

| DESIGNATION          | NAME | SIGNATURE | DATE |
|----------------------|------|-----------|------|
| HEAD<br>(PRODUCTION) |      |           |      |

#### 2.0 **OBJECTIVE:**

- To verify that the equipment operates in accordance with the design and user requirements as defined by set Acceptance Criteria and complies with relevant cGMP Requirements.
- To verify the Operational features of Check Weigher Machine and to ensure that it produces desired Quality & rated output according to manufactures specifications.
- To verify all the Operational features from user point of view of the Equipment, Cleaning Procedure, Start up & Shut down Procedure and Safety Features.

#### **3.0 SCOPE:**

- The scope of this operational qualification protocol cum report is limited to qualification Check Weigher Machine installed in Packing Hall.
- This Protocol will define the methods and documentation used to perform OQ activity the Check Weigher Machine for OQ.
- Successful completion of this Protocol will verify that Check Weigher Machine meet all acceptance criteria and ready for Performance Qualification.

## 4.0 **RESPONSIBILITY:**

The Validation Group, comprising of a representative from each of the following departments, shall be responsible for the overall compliance of this Protocol cum Report:

| DEPARTMENTS       | RESPONSIBILITIES  |  |  |
|-------------------|---|--|--|
| Quality Assurance | Preparation, review Authorization and Compilation of the Operational      |  |  |
|                   | Qualification Protocol cum Report.  |  |  |
|                   | Co-ordination with Production and Engineering to carryout Installation    |  |  |
|                   | Qualification.  |  |  |
|                   | Monitoring of Operational Qualification Activity.                         |  |  |
|                   | Review & Post Authorization of Operational Qualification Protocol cum     |  |  |
|                   | Report.   |  |  |
| Production        | Pre Approval of Operational Qualification Protocol cum Report.            |  |  |
|                   | • To Co-ordinate and support for Execution of Qualification study as per  |  |  |
|                   | Protocol.   |  |  |
|                   | Post Approval of Operational Qualification Protocol cum Report after      |  |  |
|                   | Execution.  |  |  |
| Engineering       | Review of Operational Qualification Protocol cum Report.                  |  |  |
|                   | • Co-ordination, Execution and technical support in Check Weigher Machine |  |  |
|                   | Installation Qualification Activity.                                      |  |  |
|                   | • Responsible for Trouble Shooting (if occurs during execution).          |  |  |
|                   | Post Approval of Operational Qualification Protocol cum Report after      |  |  |
|                   | Execution.  |  |  |

#### 6.0 SYSTEM DESCRIPTION:

The Checkweigher contains display conveyor belt control box automatic sensor for over & underweight variation other machine signal rejection foreign product rejection

#### The Checkweigher consists of following Parts:

- Infeed conveyor
- Photo sensor/reflector
- Weighing conveyor
- Display
- Control box
- Power switch
- Rejecter (option)
- Rejecter conveyor (option)

## 6.1. PREPARATION FOR INSPECTION:

- Ensure that the Checkweigher is level and if necessary make adjustments.
- Allow the device to warm up for the specified time to guarantee stable measurements.
- Checkweigher Machine at least 30 minutes
- Use traceable standard weights of appropriate class for testing.
- Allow the standard weights time to adjust to the ambient temperature before testing.
- Ensure display reads zero when there is no load on the measurement conveyor.

## 6.2. STANDARD WEIGHTS USED FOR CALIBRATION

Use traceable standard weights and document the necessary information for management.

## 6.3. ADJUSTMENT

Use traceable standard weights to check and record measurement error before using the Checkweigher. Before the error test confirm that zero is displayed when there is no load on the measurement conveyor. If measurement error is outside the acceptable range, make adjustments to the device and once again once again use standard weights to check and record measurement error. Refer to the instruction manual for information about adjustment.

## 6.4. **REPEATABILITY TEST:**

## 6.4.1. CONVEYOR IS STATIONARY:

This test ensures that when the same load is measured with the practical methods under constant test conditions the results are the same. The standard weight used in this test is less than the maximum load. First, record the indicator value when there is no load the measurement conveyor. Next place the standard weight in the centre of the measurement conveyor, record the value, and remove standard weight. Subtract the "zero" from the "weight" and record the standard deviation.

## **6.4.2.** TEST PROCEDURE:

- Ensure there is no load on the measurement conveyor and take the zero.
- Record the value in the "No Load" column.
- Place the standard weight in the center of measurement conveyor and record the result in the "with Load" column. Remove the weight.
- Repeat step 2 and 3 time.
- Subtract "No Load" and "With Load" record the standard deviation. Check whether this value falls within the allowed error range and determine whether it passes of fails the test.

## 6.4.3. CONVEYOR ACTIVE (SAMPLE):

- This test ensures that when the same sample is measured with the same practical method under constant test conditions the results are the same.
- The weight of the sample used in the test is less than the maximum load.
- First, when there is no load on the measurement conveyor take the zero. Next place the sample in center of the measurement conveyor and record the result. Then turn on the conveyor. Measure and record the display value for the sample.

## **TEST PROCEDURE:**

- Ensure there is no load on the measurement conveyor and take the zero.
- Place the sample in the center of the measurement conveyor and record the result in the "weight (stationary)" column.
- Turn on the conveyor
- Record the measurement result.
- Calculate the average, Maximum and Minimum values. Check that values fall within the allowed error range and determine whether it passes or fails the test.

## 6.5. CORNER LOAD ERROR TEST:

This test determines the measurement error for measurements taken away from the centre of the measurement conveyor. Divide the conveyor into 4 segments and use a standard weight of about 1/3 of the maximum capacity and measure from each segment.

## **TEST PROCEDURE:**

- Take the zero
- Prepared the standard weight of about 1/3 of the maximum capacity of the device.
- Place the standard weight in the center of the measurement conveyor and record the weight.
- Next place the standard weight at position 2 and record the weight.
- Continue this process for positions 3 through 5.
- Calculate and record the deviation from the center "1" value.
- Checks pass if the deviation falls within the allowed range and fail if not.

#### 6.6. LINEARITY TEST:

This test involve placing successive standard weights in order up to a maximum weight on the measurement conveyor and recording the measurement value each time. Perform measurement for 2 or more points are described below.

- 2-point test: 1/2 weight and the maximum weight.
- 3 point test: 1/3 weight, 2/3 weight and the maximum weight.
- 4- point test 1/4 weight, 1/2 weight, 3/4 weight and the maximum weight

#### **TEST PROCEDURE:**

- Take the zero.
- Determine the number of measurement points and prepare the appropriate standard weights.
- Place the standard weight in the center of the measurement conveyor and record the value.
- Add another standard weight and record the display value. Repeat this until the maximum weight is reached.
- Calculation the deviation and check pass if it falls within the allowed error range and fail if it does not.

## 7.0 PRE – QUALIFICATION REQUIREMENTS:

#### 7.1 Verification of documents:

The results of any tests should meet the limits and acceptance criteria specified in the test documents. Any deviations or issues should be rectified and documented prior to OQ commencing.

## 8.0 CRITICAL VARIABLES TO BE MET:

## 8.1 **Operational and Functional Checks:**

Operate the Check Weigher Machine as per Manufacturer's Manual/SOP and Check for the following functions of the Equipment. The Equipment should function as desired.

| Function   | Acceptance Criteria                                 | Observation | Checked<br>By<br>Engineering |
